

Sentriant™

Sentriant detects and mitigates rapidly propagating threats in seconds.

Voice-Class Availability

- Detect and actively defend against threats without interfering with network traffic
- Sentriant is not an inline device, therefore cannot be a bandwidth bottleneck or point of failure

Hyper Detection and Active Deception

- Create a network of virtual decoys in the unused IP address space as an early warning system that fires an alert when a virtual target is contacted
- Mimic basic responses to TCP, UDP, and ICMP requests, and make it difficult for a hacker to determine which devices are real and which are not—allowing valid machines to hide in the white noise of virtual decoys

Surgical Defense

- Isolate the source of attacks and prevent them from communicating with the remainder of the network
- CLEAR-Flow detects and surgically mirrors only the threatening traffic to Sentriant, allowing it scale into higher line-rates of inspection and mitigation

Types Of Threats

- Viruses/Worms: Zotob, Sasser, Welchia, SQL Slammer, Blaster MyDoom and others
- Denial of Service (DoS): IP Spoofing, MAC Spoofing, Smurf, Ping of Death, Ping Sweep, Ping Flood, Port Sweep, SYN Flood, TCP Xmas, Syn/Fin, Null, All Flags
- Day-Zero, Multi-Vector, Blended attacks, Polymorphic viruses

Sentriant is a security appliance that secures the network interior against rapidly propagating threats including Day-Zero attacks. Sentriant is designed to work in conjunction with Extreme Networks® Security Rules Engine—CLEAR-Flow. Together, Sentriant and CLEAR-Flow provide:

- Continuous monitoring of all end-points as threat sources launching internal attacks
- Filtering out of basic attacks, such as DoS attacks, across multi-gigabit switched networks
- Deeper analysis of suspicious traffic without impacting the operation of live networks
- Enforcement of rapid security mitigation actions against specific threat sources across the enterprise

Sentriant uses behavior-based threat detection methods (no signatures, no heuristics) to detect threats—including new threats for which no signatures exist at the time of attack. It also includes a sophisticated early warning system that employs unused IP space to identify threats. Sentriant is not an inline device, creates no performance impact to networks, and cannot jeopardize network availability—even while the network is under attack.

Sentriant incorporates an aggressive protocol-independent, automated threat termination technology. This technology does not use software desktop agents, TCP resets, or switch-dependent VLAN shunting to compartmentalize an infected end-point.

Sentriant and the CLEAR-Flow Security Rules Engine are part of the Extreme Security Framework (ESF) that is a comprehensive, scalable and easy to use network-based security solution.

Passive Operation

Sentriant is commonly deployed on a mirror port on a switch, much like a network sniffer. However, unlike sniffers, Sentriant can actively engage, deter and terminate malicious behavior. This deployment model gives systems administrators strong security control over the internal network without the latency or single point of failure risks associated with inline devices.

Hyper Detection

On a typical network that uses private IP address space, as much as 80% of IP address space is unassigned. Sentriant uses this asset to identify threats.

Since most worms must conduct reconnaissance to spread, there is a high probability that worm activity will hit the virtual decoys in the unused IP address space. Therefore, administrators have a much better chance of being alerted to malicious activity quickly, giving them more time to respond.

Active Deception

Sentriant provides false data about the network topology in order to deceive fingerprinting-malware designed to provide precise data about operating systems and application versions present on a network. This deception makes it difficult for the malware to attack the network effectively.

Sentriant can also actively engage an attacker during the network reconnaissance that generally precedes a threat, dramatically slowing the scanning process and giving administrators time to understand and thwart the attack. During this time, Sentriant will continue to provide false data to the scan itself, slowing or even stopping the attack and providing misleading information to the attacker.

Surgical Defense

Sentriant can logically insert itself in between one or more attackers and one or more target devices by redirecting communications streams from attackers to itself. Sentriant can then selectively pass or silently drop packets based on their threat potential, thereby, isolating infected computers while permitting all other communication to flow normally on a network. This process occurs at both Layer 2 and Layer 3 of the Open System Interconnection (OSI) reference model.

Surgical defense can be invoked either manually by an administrator or automatically by the product when a threat is detected. It represents a departure from previous network security systems by combining the best characteristics of an inline protection system with the performance and reliability benefits of a passive device.

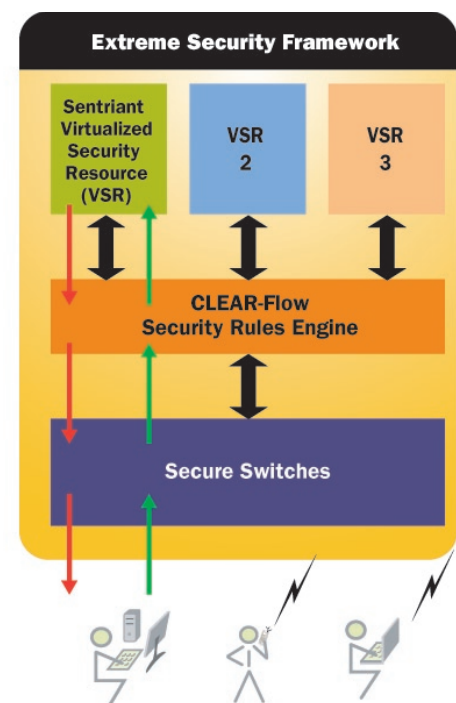

Extreme Security Framework

Building on its proven expertise in delivering high-performance, highly available networks, Extreme Networks offers ESF that provides robust multi-gigabit security across all end-points.

ESF consists of Extreme Networks secure switches, CLEAR-Flow Security Rules Engine and Virtualized Security Resources (VSRs). The secure switches are packed with security features that help the network administrator to address operational necessities like user and usage policies, various security attacks, internal firewalling, and such. CLEAR-Flow Security Rules Engine provides first order threat detection and mitigation and mirrors traffic to VSRs for further analysis of suspicious traffic in the network. VSRs are the final piece in the ESF. VSRs are virtually available across the entire multi-gigabit network thus enabling cost-effective scalability of the security solution.

ESF enables end-point authentication and host-integrity checking, filters out DoS attacks at wire-speed, and enables threat-specific security solutions (termed as VSRs) to process mainly suspicious traffic.

As shown in the figure, multiple threat-specific VSRs can be integrated into the ESF while each VSR can be concurrently deployed to process individual threats. As an example, the Extreme Sentriant VSR is designed to detect, analyze and mitigate rapidly propagating threats such as virus or worm storms (for example Slammer, Welchia and MyDoom).

Passive Operation

Sentriant can be deployed in two modes of operation—Standalone mode and Integrated mode.

Integrated Deployment Mode

Sentriant connected to the BlackDiamond® 10808 switches offers the most benefits and is the recommended deployment mode. Benefits include:

- Greater performance: Since CLEAR-Flow detects and filters out DoS attacks, Sentriant can focus its resources on largely suspicious

traffic, hence offering higher performance under load

- Broader range: Sentriant can analyze mirrored traffic. Access to all the mirrored traffic from threat-sources enables a quicker response time to potential attacks, as opposed to a narrower range of traffic presented via span-ports
- Dynamic Mitigation Control: Sentriant can add/modify the BlackDiamond 10808 switch's CLEAR-Flow rules and ACLs to inspect additional traffic or change inspection thresholds—thereby allowing an automated system to fine-grain inspection rules in real-time

Standalone Deployment Mode

Sentriant can be connected to any vendors' switches via mirror or span ports. In this mode, Sentriant can monitor broadcast traffic from across thirty-two VLANs.

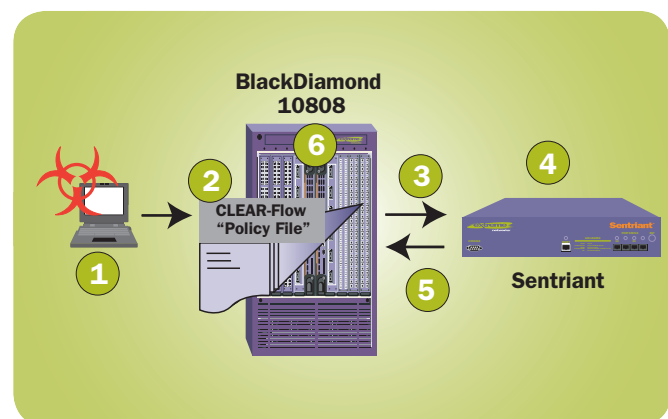

Deployment Modes

Sentriant is designed to operate seamlessly with perimeter and end-point security products in a standalone deployment mode; however, Sentriant offers the greatest benefits operating in an integrated mode within the ESF as shown in the chart. Sentriant provides a unique and differentiated set of features in the standalone and integrated deployment modes.

Integrated Deployment	Standalone Deployment
Sentriant works with Extreme Networks switches running ExtremWare® XOS™, CLEAR-Flow, and the XML-API for dynamic switch assisted mitigation.	Sentriant works with all vendor switches in broadcast only and fully mirrored deployments.
More effective use of Sentriant resources acting on a reduced load filtered by the CLEAR-Flow Security Rules Engine. Scales a single Sentriant across the whole network.	Without CLEAR-Flow, Sentriant continues to provide effective detection and mitigation of the source of attacks.
Sentriant can dynamically refine filtering criteria using dynamic ACLs to the core switch.	Sentriant filtering criteria are not coupled with the switch ACLs.
Detection and mitigation across a single mirrored port at multi-gigabit line rates with CLEAR-Flow, including 25 Gbps and beyond.	Detection and mitigation across a single mirrored port at 1 Gbps.
Unified Management Structure and CLEAR-Flow enable rich policy features (example: Role, Port, VLAN, QoS—finer granularity for each detection or mitigation action).	Distinct device-level manager (Sentriant Console Manager) and basic Cloaking mitigation.

Automated Attack Mitigation in Integrated Deployment Mode

1. An infected source enters the network.
2. BlackDiamond 10808 static ACLs and CLEAR-Flow rules filter out DoS attacks, determine traffic class as 'suspicious'.
3. Selectively port-mirror traffic to Sentriant for further analysis.
4. Sentriant continues to watch suspicious traffic and uses its internal rules to escalate traffic-class from suspicious to high level alert.
5. Sentriant initiates a dynamic ACL on the BlackDiamond 10808. BlackDiamond 10808 applies the dynamic ACL in real-time and continues to port mirror suspicious traffic. Sentriant also sends the mitigation action to Extreme Networks' EPICenter® network management software.
6. EPICenter works with core and edge switches to enforce the security policy (mitigation action).

Technical Specifications

Performance

Traffic Level (Inspection, Mitigation)	1 gigabit/sec aggregate traffic
Protected end-points	(Typical) 1000 end-points protected
Protected IP space	(Typical) 16K of used and unused IP addresses
Number of VLANs	Up to 32 VLANs

Appliance Internals

Processors	Two Intel Xeon Processors (2.8 Ghz/ea)
Memory	2 GB of ECC DRAM
Hard Drive	40 GB
Network Interfaces	4 Intel 10/100/1000 NICs
Power Supply	Single 380W
Power Connection	120V/50/60Hz, US Connectivity (U.S. cable only)
Cooling	Two 80mm Fans
Startup Access	Serial RJ45 Access
Operating System	Hardened Linux Kernel tuned for SentiAnt

Chassis

Height	2RU (3.5 inches)
Depth	17.8 inches
Width	17.3 inches
Mounting	Bracket-based front mount
Certifications	UL 6950-1-IEC 6950-1 (U.S./Canada/Europe) FCC Part15/ICES003 Class A Emissions (U.S./Canada) CE (European Union) VCCI Class 1 ITE (Japan)

SentiAnt Management System

Platform Requirements

Operating System	Windows XP/2000/Server 2003
Processor	Intel Pentium 4 (or equivalent)
Memory	512 MB
Hard Drive	1 GB (minimum)

Operation

Access	Native application on client system
Security	Access IP and certificate-based security

Ordering Information

Part

Number

Description

70011	SentiAnt Appliance (1 Gbps, 2RU chassis) includes:
	<ul style="list-style-type: none"> SentiAnt Console Manager SentiAnt MOC (Management Operations Console) CLEAR-Flow security policy files library (Software package for SentiAnt in Integrated Deployment Mode)

Note:

Ordering information for Extreme Switches that work in conjunction with SentiAnt are as follows:
